

What happens to the volume of a cylinder with radius 4 in. and height 3 in. when you scale the radius?

Damien's "Double the Radius" Method

If I double the radius, I have a new radius of 8 in.

Let me calculate the volume with the new radius.

If I divide the new volume by the original, I see that doubling the radius causes the volume to be four times the original!

$$V = \pi r^2 h$$

$$V = \pi(8)^2(3)$$

$$V = 192\pi \text{ in.}^3$$

$$\frac{192\pi}{48\pi} = 4$$

What happens to the volume of a cylinder with radius 4 in. and height 3 in. when you scale the radius?

Sydney's "Halve the Radius" Method

$$V = \pi r^2 h$$

$$V = \pi (2)^2 (3)$$

$$V = 12\pi \text{ in.}^3$$

$$\frac{12\pi}{48\pi} = \frac{1}{4}$$

If I halve the height, I have a new radius of 2 in.

Let me calculate the volume with the new radius.

If I divide the new volume by the original, I see that halving the radius makes the volume  $\frac{1}{4}$  the volume of the original!

$$\frac{12\pi}{48\pi} = \frac{1}{4}$$

#### V.4: *Scaling the Radius*

1) What are the similarities and differences between Damien and Sydney's methods?

Similarities	Differences

2) When you scale the height of a cylinder by some number, the volume is multiplied by that number. Why is that NOT true when you scale the radius?

3) If a cylinder has a radius of **3 in.** and a volume of **11 in.<sup>3</sup>**, what would the new volume be if the radius were scaled to **9 in.**?

4) What happens to the volume of a cylinder if you multiply the radius by any number,  $x$ ?

What happens to the volume if the radius is doubled and the height is 3 in.

This was interesting to see the differences between making the radius bigger and making it smaller. When Damien doubled the radius, the volume was 4 times the original, but when I halved the radius, the volume was only  $\frac{1}{4}$  the original.

Method

If I halve the radius, I have a new radius of 2 in.

Let me calculate the volume with the new radius.

If I divide the new volume by the original, I see that halving the radius causes the volume to be  $\frac{1}{4}$  the original.
