## Sit and Reach! Activity Data Sheet

## Group Members:

$\qquad$
Part One: Choose one of your group members to perform the sit and reach three times and record each trial in the table below. Find the average of your three trials.

| Student One Data Table |  |
| :---: | :---: |
| Trial | Sit and Reach Distance (in) |
| 1 |  |
| 2 |  |
| 3 |  |
| Average |  |

Part Two: Choose three variables your group agrees impacts an individual's ability to sit and reach further. Record those variables for Student 1 and include them in the data table below.

| Variables | Student One's Measurements |
| :---: | :--- |
|  |  |
|  |  |
|  |  |

Part Three: Use the space below to design an equation using Student One's average reach measurements and variables.
$\qquad$

Part Four: Choose another group member to serve as Student Two. Record their data for each of the same variables used for Student One.

| Variables | Student Two's Measurements |
| :--- | :--- |
|  |  |
|  |  |
|  |  |

Part Five: Plug Student Two's variables into your equation and predict how far they should be able to sit and reach.

## Prediction Based on Equation:

$\qquad$
Part Six: Have Student Two complete the sit and reach three times. Record each measurement in the table below and calculate the average.

| Student Two Data Table |  |  |
| :---: | :---: | :---: |
| Trial | Sit and Reach Distance (in) |  |
| 1 |  |  |
| 2 |  |  |
| 3 |  |  |
| Average |  |  |

Was your prediction correct?

Part Seven: If your prediction was not correct, use the space below to create an equation to better fit your data.
$\qquad$
